

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) Who is your customer? i.e. working parents of 0-5 y.o. kids Primary: ServiceNow administrators / configuration developers who build and maintain the Incident form. Users: Service Desk agents and L1/L2 support engineers who create and update Incidents every day. Beneficiaries: Incident / service managers who rely on accurate data for triage, SLA tracking and reporting.	6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices. • Must use out-of-the-box ServiceNow tools (UI Policy, Client Script) - no external apps. • Logic must stay lightweight so form load / save is not slowed down. • Agents enter data under time pressure with little training. • Rules must not block low-impact incidents (conditional only). • Needs admin / configuration access; client scripts run in strict mode (no DOM access).	5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking • Manual checks / agent awareness: relies on people; inconsistent and error-prone. • Server-side Business Rules / Data Policies: errors found only after submit, late feedback. • Dictionary-level mandatory fields: always mandatory, cannot depend on Impact. • Process documents / checklists: not enforced on the form.	Explore AS, differentiate
Focus on J&P, tap into BE, understand RC	2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides. • Make Assignment group mandatory and Assigned To required when Impact is High. • Keep Urgency consistent with Impact (auto-set to High, read-only). • Stop incomplete or invalid Incidents from being saved. • Prevent uncontrolled State changes from the list view. • Give users instant, on-screen feedback instead of fixing data later. • Revert controls automatically when Impact is no longer High.	9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations. • Data entry depends on user awareness and manual checks - there is no UI-level enforcement. • Impact, Urgency, Assignment group and Assigned To are not linked by conditional rules. • Inline list editing lets users bypass the rules applied on the form. • Result: incomplete or incorrect data, wrong triage / routing, SLA misses and unreliable reports.	7. BEHAVIOUR What does your customer do to address the problem and get the job done? i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace) • Agent opens the Incident form, fills Caller, Short description and sets Impact / Urgency by judgement. • Optional fields such as Assignment group / Assigned To are often skipped. • State is edited directly in the list view for speed. • Managers and admins later chase owners, correct records and clean up reports.	Focus on J&P, tap into BE, understand RC
Identify strong TR & EM	3. TRIGGERS What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news. • A High-impact Incident is raised; an SLA is breached or a ticket is mis-routed because owner / group is missing; poor data-quality reports; management asks to standardise Incident handling.	10. YOUR SOLUTION If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour. UI Policy "High Impact Control" (Incident): when Impact is 1 - High, Assignment group becomes mandatory and Urgency read-only; Reverse if false = true. onChange Client Script: Impact = High sets Urgency = 1 (High) and shows an info message. onSubmit Client Script: blocks save when Impact is High and Assigned To is empty (error box). onCellEdit Client Script: blocks State changes made from the list and alerts the user.	8. CHANNELS of BEHAVIOUR 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7 ServiceNow Incident form (set Impact, Urgency, Assigned To; Submit / Update) and Incident list view (inline edit); instant error boxes, info messages and alerts. 8.2 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development. Service desk phone / walk-in intake, team briefings on the mandatory-field rules, and feedback from Incident managers on data quality.	Extract online & offline CH of BE
