

Project Design Phase
Proposed Solution Template

Team ID	SWTID-2026-5404
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Incident records need accurate, consistent data for triage, routing and resolution, but relying on user awareness and manual checks leads to incomplete or incorrect entries, hurting reporting, SLA compliance and service quality. Field behaviour and validation must be enforced at the user-interface level before an Incident is submitted.
2.	Idea / Solution description	Use ServiceNow client-side controls on the Incident table: a UI Policy High Impact Control (Impact = 1 - High makes Assignment group mandatory and Urgency read-only, with Reverse if false); an onChange Client Script that auto-sets Urgency to High; an onSubmit Client Script that blocks saving when Impact is High and Assigned To is empty; and an onCellEdit Client Script that blocks State changes from the list view. All were tested end to end.
3.	Novelty / Uniqueness	Combines declarative UI Policy actions with targeted Client Scripts so rules react instantly on the form and in the list, with no server round-trip or custom application. Reverse if false restores fields automatically when Impact changes.
4.	Social Impact / Customer Satisfaction	Agents get clear, immediate guidance and make fewer mistakes, reducing rework and escalations. Customers benefit from faster, correct routing of high-impact incidents and better SLA adherence; managers get cleaner data for reports.
5.	Business Model (Revenue Model)	Reusable configuration built on out-of-the-box ServiceNow features, so no extra licence cost. Value comes from less rework, fewer SLA breaches and better data quality; it can be offered as an implementation service or a packaged quick-start.
6.	Scalability of the Solution	Lightweight client logic that adds negligible form load. It can be extended to other fields, tables (Problem, Change, Request) and Impact levels, and moved across instances using an update set or scoped application.
